LUXURY CLIMATE CONTROL

Consulting design
and technical delivery
specialists for bespoke,
high-specification indoor
climate to the London
private residential market.

OUR METHODOLOGY

We enable beautifully, silently integrated luxury indoor climates as a complete, end-to-end solution through our unique and holistic methodology of Consultancy, Installation and Aftercare.

CONSULTANCY

Our early collaborative approach with a principal design team enables delivery of a technically sound and unique solution, informed by the architectural intent and directed by the design vision.

Our bespoke consultancy route, derived from a wealth of knowledge and experience, combines concept, technical design, feasibility and conditional surveying, and planning applications.

INSTALLATION

The unified collaboration of our designers, project managers and engineering teams with the wider project partners ensures the delivery of an installation that perfectly matches the original design intent and budget.

AFTERCARE

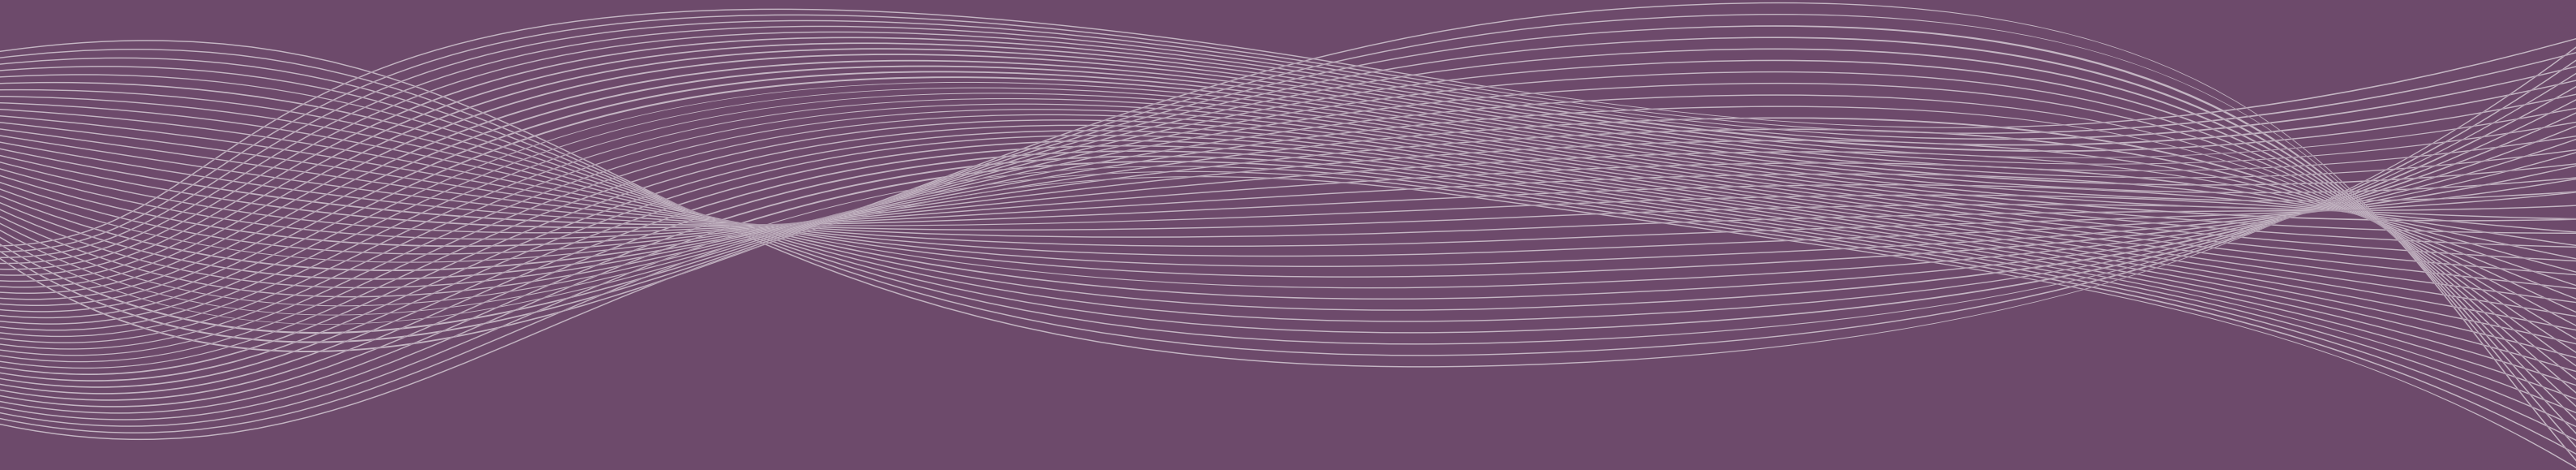

Ensuring the continuity, reliability and longevity of our systems through planned maintenance, our Aftercare Department is dedicated to customer service.

With our core values of Customer Service, Competency, Communication, Care, Cleanliness and Confidentiality, our engineering teams deliver a discreet and attentive service to the luxury property portfolio.

OUR MARKET

Partnering with designers in luxury private residential properties.

Seamlessly merging intelligent design with technical finesse to complement high-specification, bespoke interiors.

WHOLE HOUSE CLIMATE

Whole-house climate control ensures year-round comfort across all seasons. With integrated controls and whisper quiet operation, systems are designed to blend seamlessly with the interior design scheme to maximise comfort throughout the house.

PRIVATE WINE CELLARS

The cellar holds a special place within a residence, evidence of a love for a specific luxury.

Care through a precisely applied environment, involving meticulous temperature and humidity control, protects the integrity of the valuable product and enhances the long-term development of bouquet and depth. Paired with stunning interior design vision, the space comes into its own.

SWIMMING POOLS

An indoor pool is a centrepiece for the prime residence.

Many elements are brought together in this special space to create a unique design masterpiece. Whether for sumptuous relaxation as part of a private leisure complex, a more active focus as part of a fitness centric lifestyle, or any other motive, early consideration is given for mechanical systems to create the consistent and comfortable environment that is so critical to the space.

SAUNAS, SPAS AND WELLNESS

The hallmark of luxury, private spas, saunas and wellness facilities allow you to relax and unwind in the privacy and convenience of your own home.

As well as a relaxation retreat the personal health and wellness benefits include managing cardiovascular health and improving the immune system. Constant air flow and temperature regulation creates the ultimate climate for human comfort in the space.

GYMS AND FITNESS STUDIOS

A comfortable environment is critical to an effective workout, and temperature and humidity levels within the space have a direct effect on hydration and respiration levels.

Keeping these levels consistent and maintaining a supply of fresh air optimises workout conditions.

MEDIA AND CINEMA ROOMS

A state-of-the-art home cinema and media room provides an immersive cinematic experience tailored to the personal preferences of the owner.

With surround sound, advanced visuals and luxurious seating, personal comfort can be enhanced by constant ventilation and comfort cooling to this high-end entertainment space.

PRIVATE COLLECTIONS

Maintaining consistent temperature and humidity conditions allows storage of valuable and perishable artworks in your home for your daily pleasure despite the fragility of the elements they're made of.

A sympathetic environment is crucial for storing degenerative materials such as parchments and tapestries.

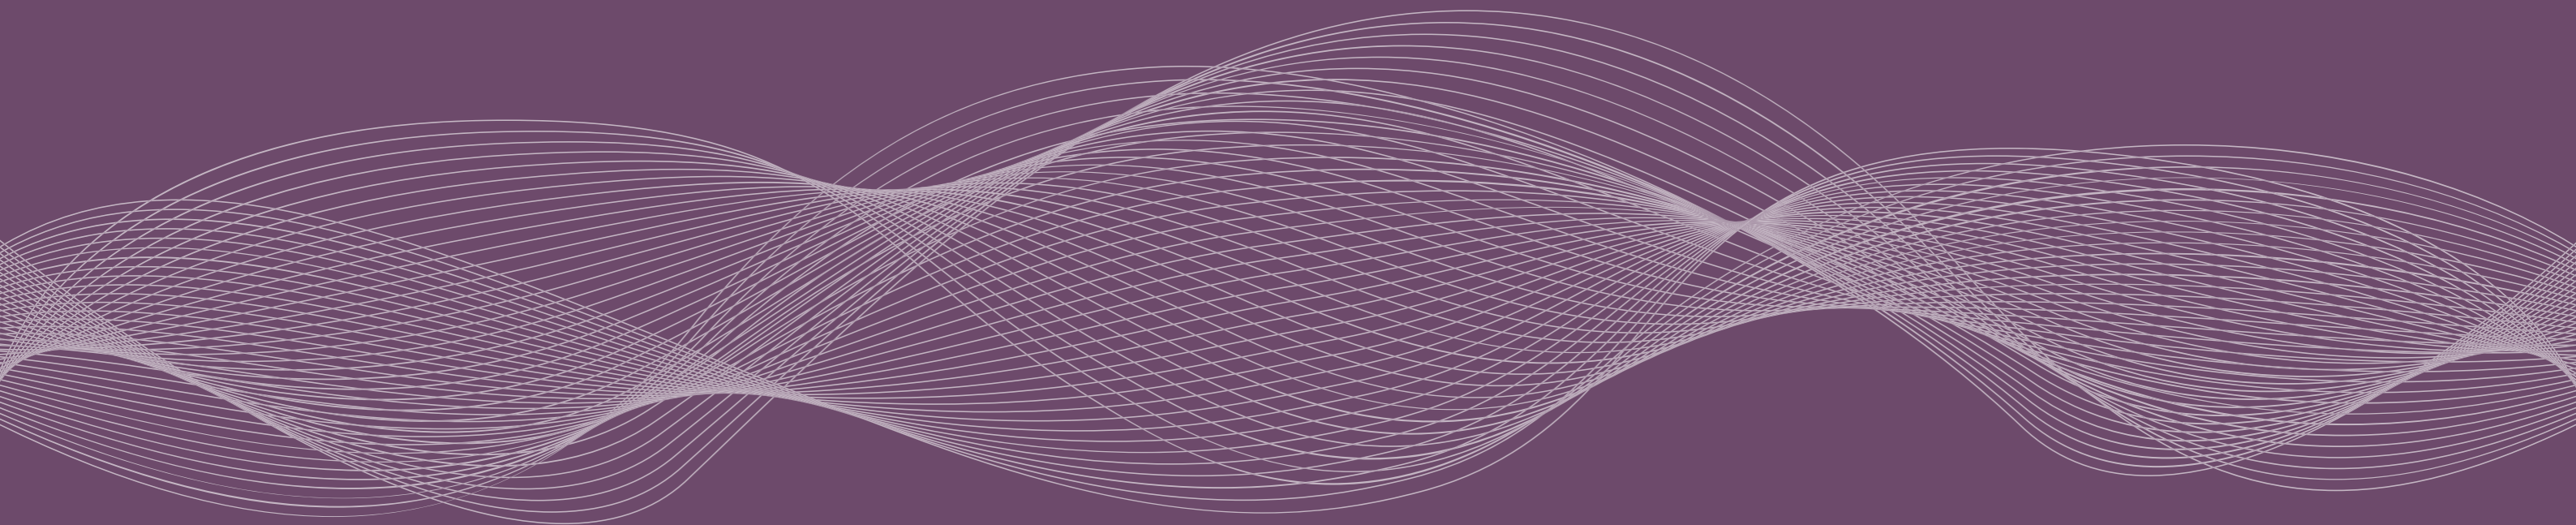

BASEMENTS

Basements are a highly effective way to expand a living space without diminishing from the property's exterior aesthetic.

Meticulously integrated air conditioning and ventilation systems discreetly ensure optimal airflow and temperature regulation, elevating the overall comfort of the space.

PORTFOLIO

BATTERSEA PENTHOUSE

- A Calibre design-developed CDP specification for climate control systems to a prestigious duplex penthouse overlooking the Thames.
- The client's private art collection, displayed throughout the property, required meticulously informed design input to ensure a sufficient flow of humidity-controlled air, and align air terminal aesthetics with the client's interior design vision.

MARYLEBONE URBAN VILLA

- Comprehensive climate control design and specification for a Grade II Listed urban villa in Marylebone.
- Listed features within the building required a highly bespoke attenuation system design to comply with both legal and spatial requirements.

KENSINGTON TOWNHOUSE

- Close collaboration with a renowned London architect to deliver mechanical systems to a five-storey townhouse in a Conservation Area.
- A dedicated media and entertainment space required coordination with other specialist services from early design stage to optimise residents' experience through the home automation system.

QUEENS PARK TOWNHOUSE

- Development of whole house climate control systems from concept stage to a practicable, fully integrated design for a three-storey Edwardian townhouse.
- An early design consideration was the integration of the ventilation equipment for the new-build basement, so the system was designed to be intelligently concealed within the joinery to create a fully functional and completely invisible solution.

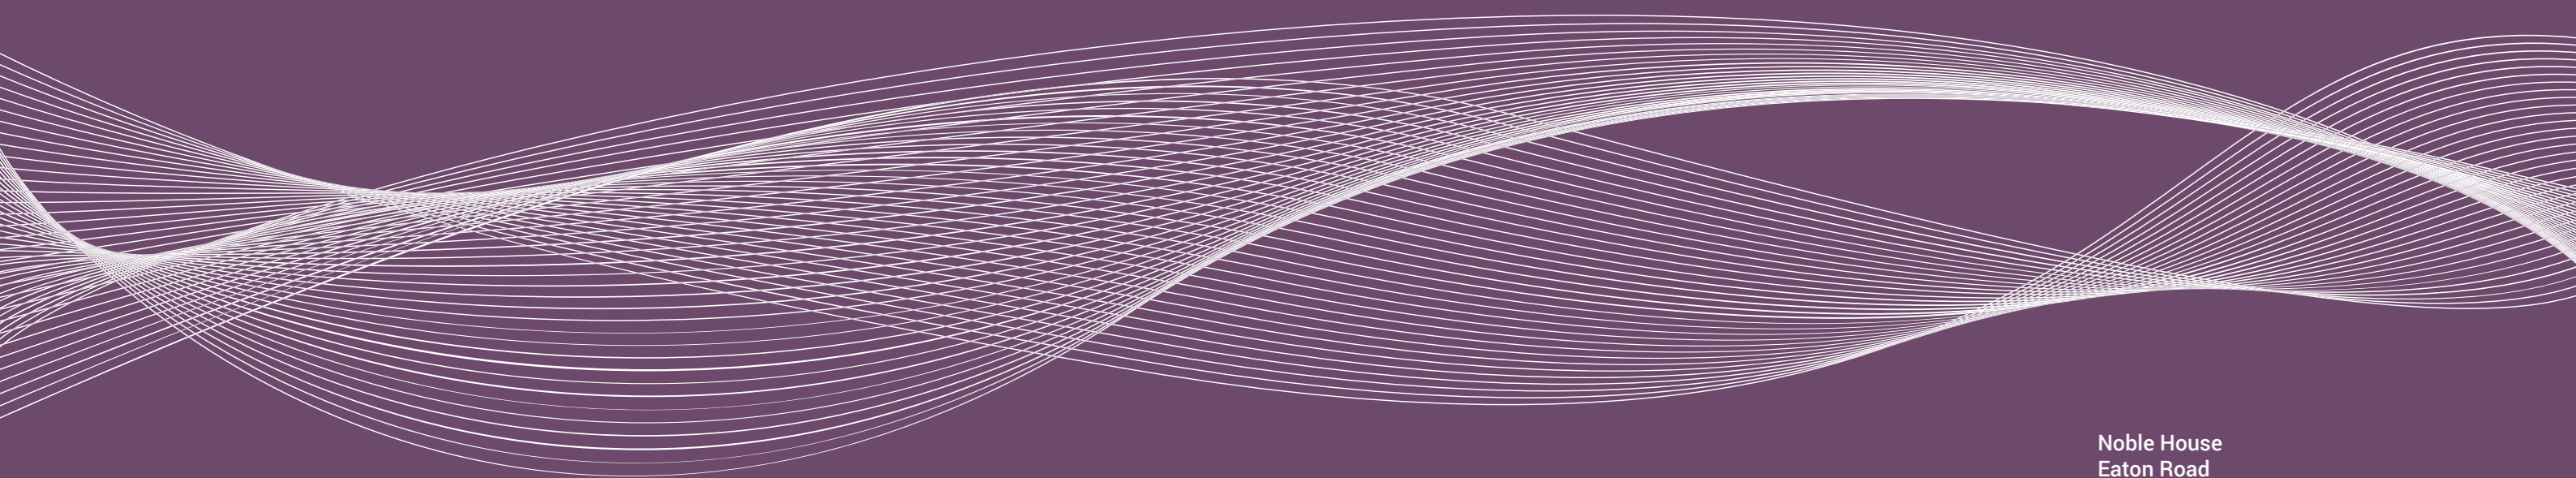

CHANNEL ISLANDS VILLA

- Full ventilation of a beautiful island villa, once the home of the commander of the garrison.
- Systems were installed during a full refurbishment and extension; sensitive design input ensured that neither interior nor exterior aesthetics were compromised by the installations.
